

Design

- A Go command with no arguments will serve a single home page with its template embedded in the binary.
 - `go get` will install this command. (5)
 - The command can then be immediately run with no arguments. (5)
- For each request, the server will open a config file located at a fixed location, read the directory from it, inject the directory into the embedded template, and serve the HTML page. (1, 4)
 - The config file will be a YAML file with the structure in ‘Config’. (3)
 - The URL for each item will be used to show an iframe corresponding to the websites thumbnail. The name for each item will be shown under the thumbnail. (2)

Config

```
directory:  
- URL: <URL>  
  name: <NAME>  
- ...
```
